A5.1 AXI transaction identifiers

The AXI protocol includes AXI ID transaction identifiers. A master can use these to identify separate transactions that must be returned in order.

All transactions with a given AXI ID value must remain ordered, but there is no restriction on the ordering of transactions with different ID values.This means a single physical port can support out-of-order transactions by acting as a number of logical ports, each of which handles its transactions in order.

By using AXI IDs, a master can issue transactions without waiting for earlier transactions to complete. This can improve system performance, because it enables parallel processing of transactions.

Note

There is no requirement for slaves or masters to use AXI transaction IDs. Masters and slaves can process one transaction at a time, meaning transactions are processed in the order they are issued.

Slaves are required to reflect on the appropriate **BID** or **RID** response an AXI ID received from a master.
