A6.3 Interconnect ordering

To meet the requirements of the ordering model, the interconnect must ensure that:

- The order of transactions in the same direction with the same ID to Device memory is preserved.
- The order of transactions in the same direction with the same ID to the same or overlapping addresses is preserved. See *Master ordering* on page A6-85 for the definition of overlapping addresses.
- The order of write responses with the same ID is preserved.
- The order of read responses with the same ID is preserved.
- Any manipulation of the AXI ID values associated with a transaction must ensure that the ordering requirements of the original ID values are maintained.
- Any component that gives a response to a transaction before the transaction reaches its final destination must ensure that the ordering requirements given in this section are maintained until the transaction reaches its final destination. See *Response before final destination* on page A6-88.
