C9.5 Exclusive Accesses from AXI components

An important consideration for the conversion of legacy AXI components for use in an ACE environment is the handling of Exclusive accesses. In a coherent environment a monitor, associated with each master, is used for shareable transactions to track whether another component has performed a store to an address that is being monitored for exclusivity. For non-cacheable transactions a monitor, which is remote from the master issuing an Exclusive access, is used to track all access to a location that is being monitored for exclusivity and this monitor can return a pass or fail response as part of the write response.

Therefore conversion of legacy AXI components for use in an ACE environment requires a monitor associated with the master interface that is being converted if the interface is capable of performing Exclusive accesses to shareable locations.
